3. Screenshots of Implementation

Figure 1. Create New Visit Form

The screenshot shows a web browser at localhost:5173/visitor-dashboard. A modal titled 'New Visit' is open, containing the following fields:

- Condominium ***: A dropdown menu with the placeholder text 'Select a condominium'.
- Unit Number ***: A text input field with the placeholder text 'Enter unit number'.
- Date of Visit ***: A date picker field showing 'mm/dd/yyyy'.
- Purpose of Visit ***: A text input field with the placeholder text 'Enter purpose of visit'.
- ID Document ***: A dashed box containing an upload icon and the text 'Click to upload an ID' and 'JPEG, PNG, or PDF (Max 10MB)'.

A blue 'Submit Visit' button is at the bottom of the modal.

Figure 2. Visit Submission Process

The screenshot shows the same 'New Visit' modal, but now it is filled with data and in the submission phase:

- Condominium ***: 'One Archer's Place'.
- Unit Number ***: '12I'.
- Date of Visit ***: '04/18/2026'.
- Purpose of Visit ***: 'web main features implemented'.
- ID Document ***: A file named '3RD YEAR - 2ND SEM.png' is uploaded, with a 'Ready to submit' status and a close button.

The 'Submit Visit' button has been replaced by a blue button with a loading spinner and the text 'Submitting...'.

Figure 3. Visit Creation Success Confirmation

Figure 4. Database Records for New Visits

The screenshot shows the Supabase Table Editor interface for the 'visits' table. The table has the following columns: user_id, unit_number, status, purpose, and visit_date. The table contains 11 records.

user_id	unit_number	status	purpose	visit_date

4. Short Summary

Overview of the Primary Feature:

The core functionality developed for this phase is the **"Create New Visit"** module. This feature enables visitors to digitally register their information and schedule upcoming visits to the condominium units through the web interface.

Data Entry & Validation Mechanisms:

The system captures the visitor's full name, specific condominium and unit information, scheduled arrival time, visit's purpose, and an ID.

Key validations include ensuring all mandatory fields are populated, verifying that scheduled dates are set in the future, and an ID document is uploaded to ensure data integrity before submission.

Operational Workflow:

Users interact with a responsive form; once submitted, the frontend validates the data before dispatching it to the backend via secure API calls. Upon backend verification, the visit record is persisted to the database and a success notification is displayed to the user.

Technical Implementation:

API Endpoint: POST [/api/visits](#) (Handles visit registration and coordinates ID image storage via Supabase storage bucket) and GET [/api/visits](#) (Lists upcoming visits scheduled for the user)

Database Schema: Operations primarily involve the *visits* table for primary record storage and the *visit_files* table for managing references to uploaded identification documents.
